

Migration

Data migration from customer's environment to BeOne solution database consists in transferring all customer and vendor records, shipments history, where possible tariffs, accounting movements and customers / suppliers balances.

After a feasibility analysis, any other data required by our customers may be transferred.

Once the migration has been effected, data are protected by computer attacks both in terms of physical and logical security.

Nova System's server farm is located in a secure place provided of access control, protection against fire, water flood, electric shocks, and possible environmental catastrophes.

Logical security is ensured by authentication and authorization of all users who are granted access to customer's applications.

After the authentication process, the transactions operated are recorded to Log Files (audit and accountability).

All customer's data are regularly archived (backup) in standard mode or, if required, in Disaster Recovery mode.
